

Productive, Not Procrastinating

Idea In Short

Track your time, write everything down and break problems into smaller chunks. Block focused time, automate repetitive tasks, prioritize ruthlessly and delegate to ambitious people who want to learn from you.

The Confession of a Procrastinator

Procrastination is a weird way to live that spouses and family members do not always appreciate, but many high-performing professionals share this tendency. Procrastination does not mean laziness. It often reflects perfectionism, anxiety or difficulty initiating complex tasks. Recognizing the pattern is the first step toward managing it rather than eliminating it entirely. ¹

Improvements That Make a Difference

Several strategies have improved productivity over time. Learning to reuse content rather than recreating the wheel saves enormous effort. Asking for a second opinion on most decisions prevents overthinking and errors. Saying no more often, as Tim Ferriss advises with the principle of hell yes or no, filters commitments effectively. Doing more work rather than perfecting one or two things aligns with Seth Godin's philosophy of shipping art. Being prolific matters more than refining, because you improve through volume and repetition. Considering the audience and asking what quality level the situation demands prevents overengineering. Being careful with performance metrics matters, because ambitious people become enamored with more of everything.

The Long Road Ahead

Time tracking reveals that approximately 50 percent of effort goes to administration, email and other noise. When applying lean operations and critical to quality principles, the focus should shift to the essence that actually matters. Generative AI will change working methods

dramatically. The percentage of AI-influenced writing, spreadsheets, presentations, research and graphics will only increase. The key reminder is that generative AI is the dumbest it will ever be. The technology improves continuously, which is why the field is called machine learning. Professionals who resist these tools will fall behind those who integrate them thoughtfully into their workflows.

Write It Down

Simple to-do lists form the foundation of productivity. The Pomodoro technique involves setting a timer and doing 25-minute sprints of focused work. Using email to send yourself reminders and clearing the inbox nightly keeps tasks visible. Taking verbatim notes in meetings captures information exactly as spoken. Post-it notes remain useful even in the digital age. Breaking down any problem into smaller chunks enables delegation or self-directed solving. A brain dump frees up thinking by capturing every thought rattling around in your head, no matter how unrelated. Keeping pen and paper everywhere ensures that random thoughts get recorded immediately. A yellow legal pad beside your workspace captures to-dos and thoughts without derailing focus on the main task. 2

Break the Problem Down

Understand the problem and organize your people, process, technology and data to solve it. Plan ahead weekly with daily check-ins to maintain momentum. Categorizing, calendaring and prioritizing form the foundation, and the first act is the most important. Start small and find ways to incentivize your desired end result. Break the problem into pieces: delegate some, do some and delete some. This decomposition transforms overwhelming projects into manageable steps that can be tackled systematically. The act of breaking things down also reveals which elements actually matter and which are noise that can be eliminated without consequence.

Block the Time

Putting tasks on the calendar transforms intentions into commitments. Block two hours to focus on deep work without interruption. Time blocking on a digital calendar combined with a prioritized to-do list creates structure and accountability. Batch processing similar tasks together reduces context switching and mental overhead. Block out your calendar religiously to protect focused work time. This is an area where many professionals remain

weak, acknowledging the need to grow and develop better habits. The calendar is a tool for protecting your most valuable resource, which is undivided attention on high-impact work.

Automate Where You Can

Embed systems thinking into everyday life to reduce friction. Automate repeated tasks that consume time without adding strategic value. Create a digital second brain that stores knowledge and processes for quick retrieval. Robotic process automation was significant five years ago, but generative AI, bots and agents now make repetitive work unnecessary. There is no reason to waste time on tasks that machines handle better and faster. The professionals who build automation into their workflows compound their productivity advantage over time, because each automated task frees capacity for higher-value thinking and creative work.

Prioritize Ruthlessly

Ruthless prioritization separates the urgent from the important. Clear the task that holds the most power over you first, because that task creates the most anxiety and mental drag. Mark Twain's advice to eat the frog first thing in the morning still applies. Let go of perfection, because perfect is the enemy of done. Focus on big things that require high-quality decisions rather than small things that consume attention. Do not be the bottleneck, because if people are waiting on you, that is a problem. The best professionals identify the two or three decisions or actions that will move the needle and direct their energy there exclusively. 3

Delegate and Work Smart as a Team

Delegate to the team rather than attempting everything alone. Attract ambitious, talented people who want to learn from you and give them meaningful responsibility. Weekly one-on-one meetings with direct reports at a set time for 45 minutes reduce interruptions and ensure steady progress. The meeting belongs to them, and managers should expect their reports to hold similar sessions with their own teams. Almost every problem has been solved before somewhere, so find out where it occurred and leverage that solution. Use project management tools like Trello to track individual and team progress. Create joint accountability with others by setting dates and committing, because shame is a powerful motivator. Co-create with your client by showing early versions and letting them put

fingerprints on the work.

Set Goals and Reward Yourself

Humans are not robots. We get bored, self-sabotage and create drama. We need attention and occasionally experience ennui. We need some jazz in our lives, so do what it takes to motivate yourself. So, give yourself grace, because we all have strengths and limitations. Procrastination is a common limitation, but it does not define your entire professional identity. Wisdom is taking your own advice, which remains the ultimate challenge for every professional who gives good counsel to others.

Summary

Productivity requires writing things down, breaking problems apart and blocking focused time. Prioritize the hardest task first, delegate to talented people and set goals with rewards. Give yourself grace, because wisdom is taking your own advice.
