Commercial Analytics & Revenue Intelligence Playbook

A four-layer revenue intelligence stack that turns CRM exhaust into forecast accuracy, deal-risk alerts, and early churn warnings.

Overview

Build the data foundation, dashboards, forecasting models, and deal-risk scoring that let commercial leaders see problems 60-90 days before they show up in a missed quarter.

Why use three forecast methods instead of just trusting the sales team's commit?

Rep-committed forecasts are systematically optimistic because reps are incentivized to project confidence. Triangulating against a pipeline-weighted model (stage probability times deal value) and a historical trend model gives you two independent checks, and tracking each method's actual error rate over time tells you which one to weight more heavily as your specific business matures.

How much historical data do we need to build a reliable deal-risk or churn model?

Four to six quarters of clean, historized CRM data is a reasonable minimum for deal-risk scoring. Churn propensity models typically need at least a year of usage and renewal data to capture a full customer lifecycle, including seasonal patterns.

What's the difference between descriptive, predictive, and prescriptive analytics in this context?

Descriptive/diagnostic tells you what happened and why (a funnel chart, a cohort curve). Predictive tells you what's likely to happen next (a forecast, a churn-propensity score). Prescriptive tells you what to do about it — a specific alert or next-best-action surfaced directly to the rep or CS manager who can act on it.

Do we need a data science team to build this, or can RevOps do it?

A skilled RevOps or data analyst can build the data foundation, dashboards, and even fairly effective rule-based or logistic-regression risk scores without a dedicated data science team. More sophisticated machine-learning propensity models benefit from data science involvement, but they're an enhancement, not a prerequisite — start with transparent, rule-based scoring.

How often should the forecast model and risk scores be recalibrated?

Track forecast-method error rates every quarter and recalibrate weighting at least once a year, or sooner after any major change in deal mix, sales cycle length, or product line. Deal-risk and churn scores should be reviewed for accuracy quarterly against actual outcomes.
