AI for Finance & Risk Management Playbook

Deploying AI in finance functions where accuracy and auditability both have to hold up

Overview

A framework for deploying AI in finance and risk management functions — forecasting augmentation, anomaly detection for financial controls, and risk model enhancement — that maintains the accuracy, auditability, and explainability finance and risk functions specifically require, rather than treating AI deployment identically across all business functions.

What makes AI deployment in finance and risk functions genuinely

different from other business functions? Finance and risk decisions often require auditability and explainability standards beyond typical business AI use cases — a forecasting error or risk model flaw can have direct financial statement or regulatory consequences, requiring

more rigorous validation and documentation than many other AI applications.

Where should finance and risk functions start with AI adoption?

With augmentation of existing processes (forecasting support, anomaly detection layered onto existing controls) rather than full automation of judgment-intensive decisions, building organizational trust and validated track record before expanding AI's role.
