# HelloFresh Chooses Profit Over Growth

## Idea In Short

HelloFresh built its business on a simple pitch: skip the grocery store and a box of pre-portioned ingredients with a recipe card arrives at the door instead. That pitch turned a 2011 Berlin startup into the world's largest meal-kit company, but by 2025 the company was deliberately shrinking its customer base rather than growing it. Active customers fell to roughly 6.9 million from 7.3 million the year before and revenue dropped 9% to about €6.8 billion, while adjusted earnings rose 14% because the company chose to keep fewer, more loyal subscribers over chasing new sign-ups with discounts. This article covers how HelloFresh went from a Rocket Internet-backed startup to a Frankfurt-listed public company, how its meal-kit and ready-to-eat businesses actually make money and why shrinking on purpose became the strategy after a decade of growth at nearly any cost.

## A Rocket Internet bet that became the market leader

HelloFresh launched in Berlin in 2011, co-founded by Dominik Richter and Thomas Griesel with backing from Rocket Internet, the German venture builder known for cloning and scaling internet business models quickly across markets. Richter has said Rocket Internet's Oliver Samwer pushed him toward the meal-kit concept, then supplied the seed capital and operating playbook that let HelloFresh expand into the Netherlands in 2012 and the United Kingdom and United States the following year. That fast, capital-heavy international rollout, funded by more than $300 million raised between 2012 and 2016 from investors including Insight Partners and the Qatar Investment Authority, let HelloFresh outpace rivals such as Blue Apron and Plated before most of them had settled on a single home market.1 The strategy worked well enough that HelloFresh had displaced most of its early meal-kit competitors by the time it looked toward going public.

## Listing in Frankfurt while Blue Apron struggled in New York

HelloFresh went public on the Frankfurt Stock Exchange in November 2017, pricing shares at €10.25 and raising up to roughly €318 million, valuing the company at about €1.7 billion.2 The timing put HelloFresh's public debut just months after Blue Apron, its main U.S. rival, had gone public on the New York Stock Exchange and immediately struggled with high customer acquisition costs and a falling share price. HelloFresh's IPO valued it at more than double Blue Apron's market capitalization at the time, a gap that widened over the following years as HelloFresh kept expanding into new countries while Blue Apron retrenched.3 Baillie Gifford has since become HelloFresh's largest institutional shareholder, holding just over 10% of the company, with Richter and Griesel remaining among its most significant individual holders.

## Buying its way into ready-to-eat meals

HelloFresh acquired Factor, a ready-to-eat meal brand, in November 2020 for up to $277 million, split between an upfront cash payment and a performance-based earn-out, extending the company's subscription model into fully prepared meals that need no cooking at all.4 The company followed with the acquisition of Youfoodz, an Australian ready-to-eat meal manufacturer, broadening the same strategy into a second geographic market. Factor has since expanded from the United States into Sweden, Denmark and Germany, giving HelloFresh a growth avenue less dependent on the original meal-kit category, whose growth slowed sharply once pandemic-driven demand faded. Ready-to-eat meals also carry different economics than ingredient kits, since customers pay for convenience rather than for cooking their own dinner, letting HelloFresh serve two distinct customer preferences under one subscription infrastructure.

## Ingredients, recipes and a box on a schedule

HelloFresh's core meal-kit business works by shipping customers pre-portioned, perishable ingredients alongside a recipe card each week, priced by the number of meals and servings a subscriber selects during sign-up. Customers choose from a rotating recipe menu built by an in-house culinary team, select dietary preferences such as vegetarian or low-carb and can skip or pause deliveries with a week's notice rather than committing to a fixed term. The company layers add-on sales, including wine, desserts and snacks, onto the core box, giving it a way to increase order value without changing its base subscription pricing. Because every ingredient must arrive fresh and in the right quantity, HelloFresh's profitability depends heavily on forecasting demand accurately enough to avoid the food

waste that plagues grocery retailers operating at similar scale.

## Choosing fewer, more loyal customers over raw growth

> HelloFresh's active customer count fell to roughly 6.9 million in 2025 from about 7.3 million a year earlier, while adjusted earnings still rose 14% to €422.8 million

That combination, a shrinking customer base and rising profitability, reflects a deliberate strategy shift rather than a company losing customers it wanted to keep. HelloFresh scaled back promotional discounting aimed at acquiring new, price-sensitive customers and instead concentrated spending on retaining tenured subscribers, whose order frequency and lifetime value run well above that of customers acquired through steep first-box discounts.5 Group revenue fell about 9% to roughly €6.8 billion in the process, a trade-off the company's management has defended publicly as the right one after years of prioritizing subscriber counts that included large numbers of customers who churned within a few boxes. The strategy mirrors a broader pattern among subscription businesses that grew quickly during the pandemic and have since had to decide whether to keep buying growth or let it settle at a smaller, more durable base.

## Competing against grocery delivery as much as other meal kits

HelloFresh's most direct competitors, including Blue Apron before its 2023 acquisition by Wonder Group and Sun Basket, have consolidated or shrunk considerably since the meal-kit category's early growth years, leaving HelloFresh with a larger relative share of a smaller overall market.6 The bigger competitive threat now comes from adjacent services: Instacart and other grocery delivery platforms let customers assemble their own meals from any recipe without committing to a subscription and prepared-meal delivery services compete directly with Factor. Traditional grocery chains have also added their own meal-kit sections in stores, undercutting one of HelloFresh's original selling points, that meal kits saved a trip to the store. HelloFresh's response has leaned on recipe variety, brand recognition built over more than a decade and its diversified portfolio across meal kits, ready-to-eat meals and multiple regional brands, rather than competing purely on price against grocery

alternatives.

## Key Partners

HelloFresh depends on farmers and food suppliers who provide the fresh ingredients that go into each weekly box, requiring close coordination to match delivery volumes with recipe menus set weeks in advance. Logistics and last-mile delivery partners move temperature-sensitive boxes from HelloFresh's fulfillment centers to customers' doors on a fixed weekly schedule. Marketing partnerships with celebrities and public figures, including cookbook author Jamie Oliver's licensing arrangement, help HelloFresh build recipe credibility and reach new audiences. Sports and entertainment sponsorships, including partnerships with National Hockey League teams, extend brand visibility beyond HelloFresh's typical digital marketing channels.

## Key Activities

Recipe development sits at the center of HelloFresh's operations, with an in-house culinary team creating and testing new meals regularly to keep the weekly menu fresh for repeat subscribers. Sourcing, portioning and packaging ingredients at scale requires precise demand forecasting, since both understocking and overstocking directly affect cost and food waste. Marketing and customer acquisition remain constant activities given the subscription model's dependence on replacing customers who churn, though HelloFresh has recently shifted spending toward retention over acquisition. Operating fulfillment centers and coordinating delivery logistics across multiple countries and brands, including Factor and Youfoodz, requires activity distinct from the core meal-kit business.

## Key Resources

HelloFresh's in-house culinary and recipe development team functions as a core resource, since the variety and quality of weekly menus directly affects subscriber retention. Its fulfillment center network and delivery logistics infrastructure, built to handle perishable goods on a weekly cycle, represent a capital-intensive resource competitors have struggled to replicate at the same scale. Customer data on order history, dietary preferences and churn patterns supports the company's shift toward retaining higher-value subscribers rather than maximizing sign-ups. The HelloFresh brand itself, recognized across more than a dozen countries, remains a resource that newer meal-kit entrants lack.

## Value Propositions

HelloFresh offers customers a way to cook varied, portion-controlled meals at home without planning menus or making a grocery trip, saving time for busy professionals and families. Subscribers can select dietary preferences, adjust household size and skip or pause deliveries with a week's notice, giving the service more flexibility than a fixed grocery order. The Factor brand extends that convenience further for customers who want prepared meals requiring no cooking at all. Add-on products such as wine, snacks and desserts let customers build out a full weekly order without shopping elsewhere.

## Customer Relationships

HelloFresh maintains relationships primarily through its subscription infrastructure, where customers set preferences once and interact with the service mainly to adjust or skip upcoming deliveries. Customer support is available through phone and 24/7 live chat on the company's website, handling delivery issues, recipe questions and account changes. Personalized recipe recommendations, based on past orders and stated dietary preferences, are used to keep subscribers engaged with the weekly menu rather than skipping boxes. Influencer and social media marketing, featuring figures such as Mindy Kaling, has been used to build an ongoing brand relationship with subscribers beyond individual transactions.

## Channels

HelloFresh sells primarily through its website and mobile apps for iOS and Android, where customers manage subscriptions, select recipes and adjust deliveries. Direct mail and digital advertising drive new customer acquisition, historically supported by aggressive discount offers for first-time subscribers. Retail placement of the Factor and other brand products in select grocery stores has extended HelloFresh's reach beyond pure subscription delivery in some markets. Email and app notifications support retention by reminding subscribers of upcoming boxes and menu selections before each weekly cutoff.

## Customer Segments

Busy professionals and families without time for meal planning or grocery shopping represent HelloFresh's core segment, drawn to the convenience of a pre-planned weekly

menu. Health and nutrition-focused consumers, including a customer base skewed toward women aged 30 to 50 according to company research, use the service to maintain consistent, portion-controlled eating habits. Customers seeking fully prepared meals rather than ingredients to cook themselves are served through the Factor brand rather than the core HelloFresh product. Tenured, high-retention subscribers have become an explicit priority segment following the company's 2025 shift away from chasing new, discount-driven sign-ups.

## Cost Structure

Food procurement and ingredient costs represent HelloFresh's largest expense, given the fresh, perishable nature of what it ships and the waste risk built into demand forecasting. Logistics and delivery costs, covering fulfillment center operations and last-mile shipping of temperature-sensitive boxes, form a second major cost category. Marketing and customer acquisition costs remain significant, though the company has reduced spending on discount-driven acquisition in favor of retention. Personnel costs, including the culinary team responsible for recipe development, add a specialized labor expense distinct from typical e-commerce operations.

## Revenue Streams

HelloFresh generates most of its revenue from subscription sales of pre-portioned meal kits, priced by the number of recipes and servings each customer selects weekly. Its ready-to-eat meal brands, primarily Factor, contribute a growing secondary revenue stream built on the same subscription logic but requiring no cooking from the customer. Add-on sales of wine, desserts and other accompaniments generate incremental revenue on top of each subscriber's base order.

## Summary

HelloFresh's shift from growth to profitability says something about the meal-kit category as a whole, not just one company's choices. The pandemic-era surge that pulled millions of new customers toward subscription cooking boxes has faded and HelloFresh's response was not to discount its way back to the old customer count but to let the least loyal subscribers go while investing in the ones who stayed. Its Factor and Youfoodz acquisitions extended the same subscription logic into ready-to-eat meals, giving the company a second growth lever beyond ingredient kits as that original category matured. The open question is whether a smaller, more profitable HelloFresh can still claim the scale advantages, in purchasing, logistics and recipe testing, that let it outlast most of the meal-kit startups that launched alongside it a decade ago.
